Figure S1: Influence of different variants of environmental and physiological factors on the immobilisation efficiency of *Bacillus thuringiensis* B1(2015b) cells on loofah sponges.

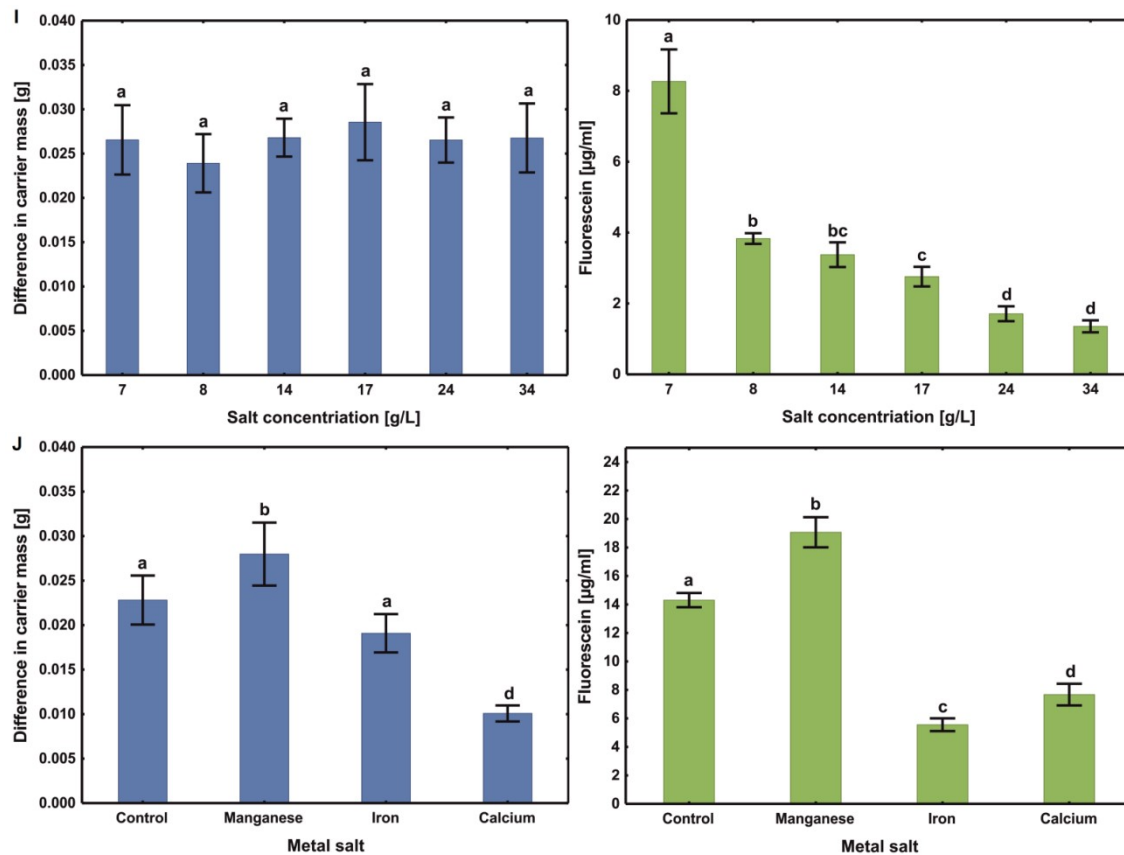

Figure S1: Influence of environmental and physiological factors on the immobilisation efficiency of *Bacillus thuringiensis* B1(2015b) cells on loofah sponges:

- (a) Immobilisation medium (Nutrient Broth, Mineral Salts Medium or HCT (medium rich in both carbon and ion sources));
- (b) Additional carbon source (Mineral Salts Medium + 0.5 g/L glucose or HTC + 0.5 g/L glucose);
- (c) Age of the culture that was harvested for immobilisation (24, 48 or 72 h);
- (d) Initial culture Optical Density (0.2, 0.4, 0.6, 0.8, or 1.0);
- (e) Agitation speed (70, 90, 110, 130 or 150 rpm);
- (f) Incubation time of the bacterial culture with a carrier (16, 24, 48 or 72 h);
- (g) Temperature (15, 20, 25, 30, or 35°C);
- (h) Immobilisation medium pH (3, 4, 5, 6, 7.2 or 8);
- (i) Salt concentration in the immobilisation medium (7, 8, 14, 17, 24 or 34 g/L);
- (j) Additional metal ions (manganese, iron or calcium).

All experiments were performed in at least five replicates. The values of the efficiency of immobilisation and enzyme activities were analyzed using a one-way ANOVA ($p \geq 0.05$) using STATISTICA 10 PL software package. A post-hoc test or T-test was applied to assess the differences between the treatments (differences are marked with successive letters a, b, c, d or e).
