Section S1. Time study

The reaction was conducted according to general procedure described in the main text. Yields were established by quantitative ^1H NMR measurements with dimethyl terephthalate as an internal standard.

Section S2. NMR spectra

The NMR spectra were recorded using a Bruker Avance Neo 400 spectrometer. All the products obtained were in agreement with the data reported in the literature,^[20-24-38] therefore further chromatographic purification step was omitted and the reaction yield was calculated based on ¹H NMR spectra of raw extracted reaction mixture with a carefully weighed aliquot of internal standard.^[23] Dimethyl terephthalate was used as an internal standard in all NMR experiments. Dimethyl terephthalate ¹H NMR (400 MHz, Chloroform-*d*) δ 8.10 (s, 4H), 3.94 (s, 6H). *Z:E* ratio was calculated based on *Z* and *E* products vinyl protons integration ratio.
