Figure S1. Study design flowchart. OS = overall survival; TMB = tumor mutational burden; mut/Mb = mutations per megabase; MSI = microsatellite instability.

Table S1. Individual survival data for genes at univariate analysis.

Gene	Patients (N)	Median OS (months)	P value
STK11			
mut	40	7	0.00004

N = number; OS = overall survival; NR = not reached.

Figure S2. Kaplan–Meier (KM) curves for each gene related with survival after Cox multivariate analysis. Kaplan–Meier (KM) curves for overall survival for patients harboring gene mutations related with survival after Cox multivariate analysis (E2F3, STK11, NTRK3, PTPRD, RNF43, TENT5C, TET1, and ZFHX3) compared to the wild-type ones.
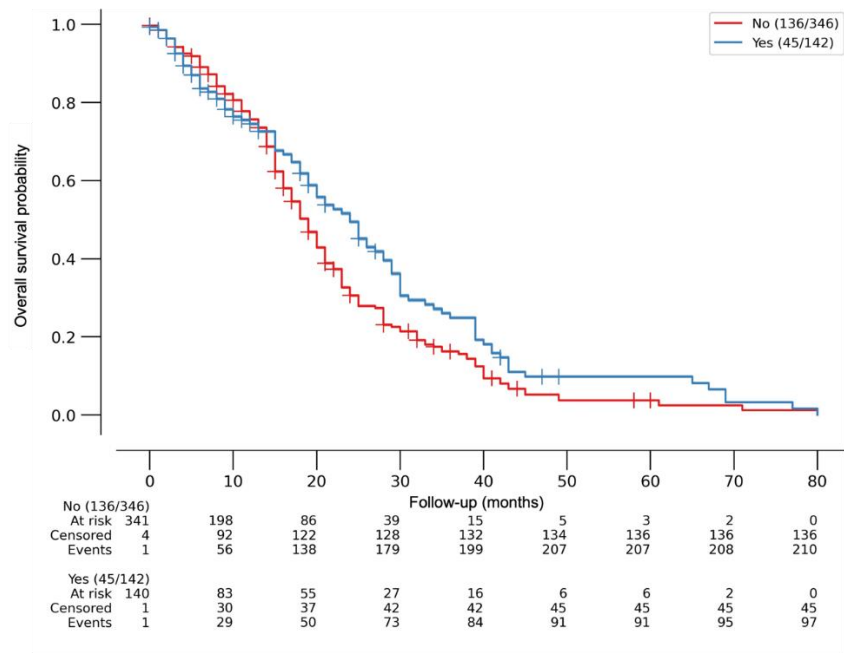

Figure S3. Effect of Microsatellite Instability (MSI) on overall survival after ICI treatment. Kaplan–Meier (KM) curves for TMB-high/MSI and with TMB-high/MSS tumors. Exploratory analyses performed in our TMB-high cohort identified that patients with TMB-high/MSI tumors exhibit better OS outcomes when compared with TMB-high/MSS tumors (median OS 42 vs 19 months; P < 0,05).

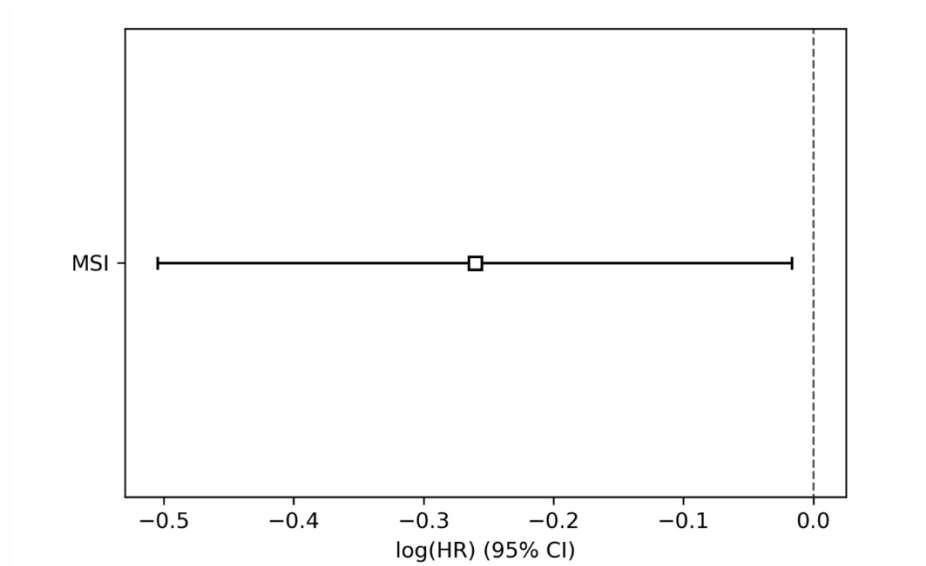

Figure S4. Effect of Microsatellite Instability (MSI) on overall survival after ICI treatment. HR for death was 0.77 (95% CI 0.60-0.98; P = 0.04).
