Immune cell abundancies across histopathological annotations

Plot frequencies of cell proportion

Anova tests

Anova comparisons Table1 across histo-pathological annotations of immune cell deconvolution absolute abundancies (p_anova). Tukey multiple comparisons of means 95% family-wise confidence level: “diff” gives the difference in the observed means; “lwr” gives the lower end point of the interval; “upr” gives the upper end point and “p_adj” gives the p-value after adjustment for the multiple comparisons. A summary is reported in Table2

Table 1: Anova comparisons across histo-pathological annotations of immune cell deconvolution absolute abundancies.
