Figure S1. The flow diagram of patient selection LHI, large hemispheric infarction; PH, parenchymal hemorrhage; BP, blood pressure; HR, heart rate

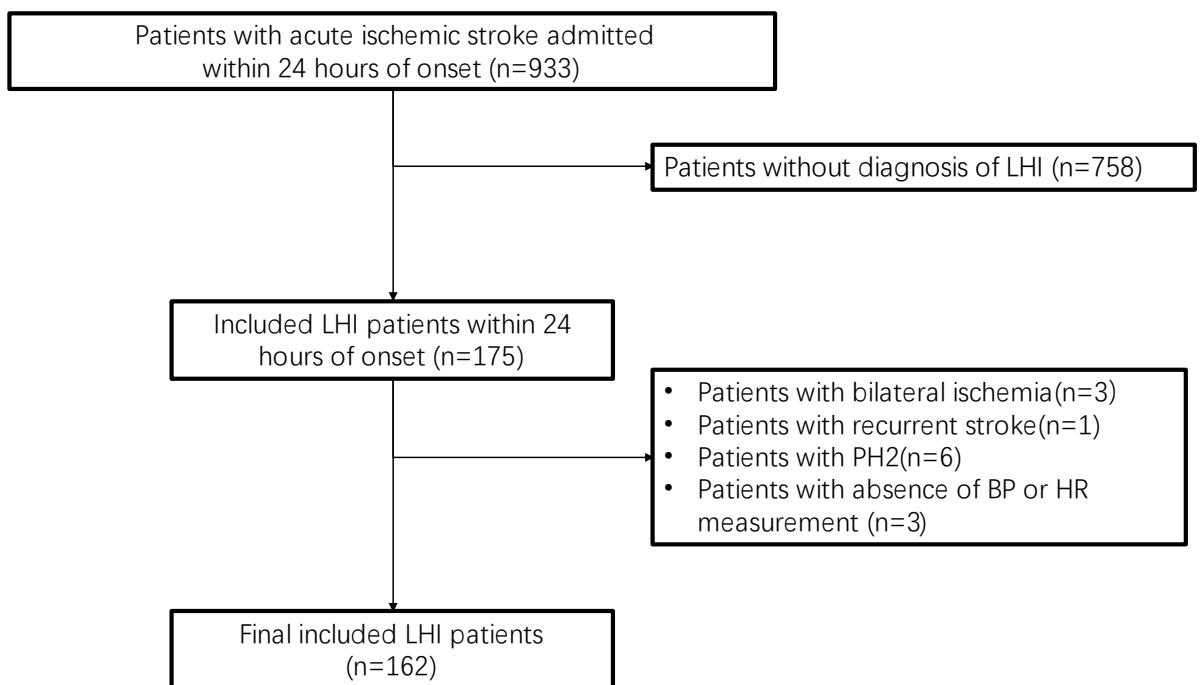

Figure S2. The 24-hour temporal evolution of heart rate/blood pressure ratios in LHI patients who died and survived within one month. (a)Temporal evolution of SI_s . (b)Temporal evolution of SI_d . SI, shock index; LHI, large hemispheric infarction; Heart rate-to-blood pressure ratios are assigned as SI_s and SI_d for systolic and diastolic pressures, respectively.

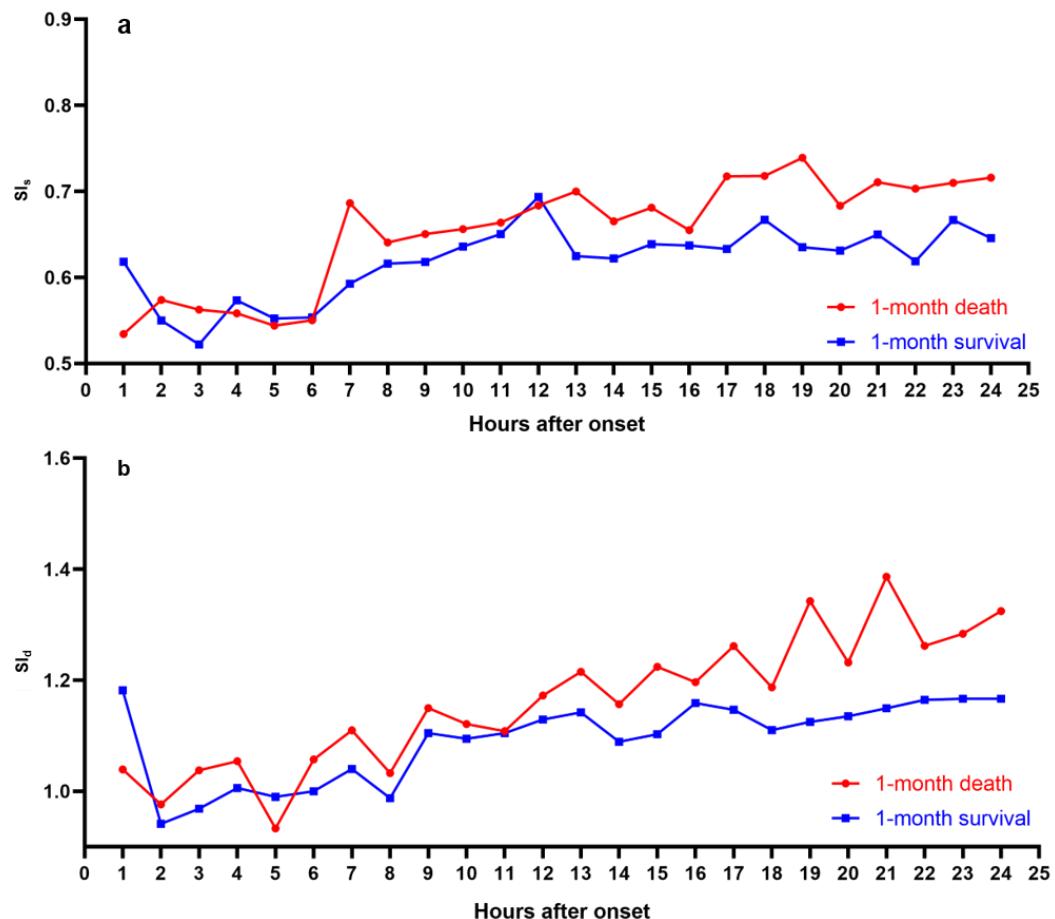

Figure S3. Kaplan-Meier survival curves for cumulative incidence of one-month death among LHI patients with high or low heart rate/blood pressure ratios during 13-24h after onset. Patients were categorized by median of SI_s and SI_d during 13-24h after onset, respectively. (a) Patients with higher SI_s had higher cumulative incidence of one-month death (log-rank $P=0.010$). (b) Patients with higher SI_d had higher cumulative incidence of one-month death (log-rank $P < 0.001$). LHI, large hemispheric infarction; SI, shock index; Heart rate-to-blood pressure ratios are assigned as SI_s and SI_d for systolic and diastolic pressures, respectively; \(\lambda\).

MBE, malignant brain edema; IQR, interquartile range; SI, shock index; max, maximum;

min, minimum; Heart rate-to-blood pressure ratios are assigned as SI_s and SI_d for systolic and diastolic pressures, respectively; range was defined as the difference between maximum and minimum.
