Supplementary Table S2. Quantitative proteomics of growth in 5% and 100% CE by TMT label-based shotgun proteomics displays profound changes in the *C. jejuni* NCTC11168 proteome at different stringencies. Proteins were defined as altered in abundance at +/-1.5-fold mean *n*-fold change (<0.67 and >1.5-fold), when observed in 2 of 4 (5% CE) or 2 of 3 (100% CE) biological replicates and with $p<0.05$. Data for all identified (1386 and 1326 proteins for 5% and 100% CE comparisons with MH controls, respectively) and quantified (1328 and 1304 proteins, respectively) proteins can be found in Data S1.
