

Supplementary Table S1

Time windows	Data sources	Aggregation functions
Last 3 years	All numeric lab data sources (not PCR or Urine which has categorical results) + vital signs + BMI + Weight	first value, last value, minimal value, maximal value , std of the values, average value
Between 3 years to 5 years	All numeric lab data sources (not PCR or Urine which has categorical results) + vital signs + BMI + Weight	first value, last value, minimal value, maximal value , std of the values, average value
Last 3 years	All numeric lab data sources (not PCR or Urine which has categorical results) + vital signs + BMI + Weight	slope - the slope of fitted linear line on the historical values
Last year	Influenza diagnosis, flu vaccination, complication event	number of events
Between 1 year to 3 years	Influenza diagnosis, flu vaccination, complication event	number of events
Last year	Categorical laboratory test: Flu RT-PCR and antigen tests, Urine tests	first value, last value, minimal value, maximal value
Between 1 year to 3 years	Categorical laboratory test: Flu RT-PCR and antigen tests, Urine tests	first value, last value, minimal value, maximal value
Between 3 years to 5 years	Categorical laboratory test: Flu RT-PCR and Antigentests, Urine tests	first value, last value, minimal value, maximal value
All history	Smoking	smoking years, pack years, time since quit smoking, smoking inteseting, current smoker?
No time	Race, Ethnicity, Age, Gender	
All history	Diabetes, Asthma, 4 levels of Asthma by severity, Chronic hear disease, COPD, Cancer, Immunosuppression, Chronic_Kidney, Chronic_Liver, Neurological_Diseas	number of events
Last year	Pregnancy	Boolean
Last 3 years	Immunosuppression_Drugs, BloodPressureDrugs, Asthma_Drugs, Asthma_Severe_Drugs, positive_pcr_flu_test	number of events
Last year	Admission length, membership coverage	number of days in this time window
Last 3 years	Admission length, membership coverage	number of days in this time window
Last 5 years	Admission length, membership coverage	number of days in this time window
Between 1 year to 3 years	Admission length, membership coverage	number of days in this time window
Between 3 years to 5 years	Admission length, membership coverage	number of days in this time window
Last year	Diagnosis ICD10 codes, Medication - ATC codes	number of events
Last 5 years	Diagnosis ICD10 codes, Medication - ATC codes	number of events
Last year	Admission type, outpatient visit type, hospital transfer department, billing code, procedure, admission reason	number of events
Last 5 years	Admission type, outpatient visit type, hospital transfer department, billing code, procedure, admission reason	number of events

Level 3    Complication Tier 3    Severe illness	Laboratory Registry +/- ICD code	Laboratory Registry	Phenomic Registry	ILI Subgroup	Control group

**Supplementary Table S5 [Steps in deployment for the rule set that informed data filtering for the model(s)]**

1. When the ratio between the descender count and the ascender count is similar, only the ascender code is retained, due to the preference for using the more granular codes. For example, if a descender has 10,000 examples (and an ascender has 10,100 examples, the additional 100 examples represent only 1% of the data; therefore, the ascender was eliminated. The control threshold for this process was set to 5%.
2. When the ascender "behaves" differently from at least 2 descenders, such that aggregation of the descender into the ascender might be unreasonable, the ascender was removed. The occurs with different enough statistical properties of p\_value and average lift. For example, when parameters equal [filter\_child\_pval\_diff (default value is 1e-10) + filter\_child\_lift\_ratio]. The default value was set to 0.05. When both the p\_value difference between ascender and descender is below filter\_child\_pval\_diff AND the difference in average lift is below filter\_child\_lift\_ratio.
3. When a node had a descender that passed the above filters and a descender that did not pass and was removed, if the aggregated sum of the removed examples is high, removal of ascender is considered. In other words, if the ascender contains descenders with different enough meanings, then it makes less sense to use them together. For example, if an ascender that has 10,000 examples and descenders with 8,000 examples were filtered, then the ascender is left with descenders that consist with 2,000 examples. In this scenario, it would make no sense to use a more granular ascender code that would result in 80% of examples being filtered.

Supplementary Table S9 (Bias Analysis using a simple age cutoff to classify individuals > 65 yrs. as high-risk, by each attribute of interest.)

Group (% of total population)	Sensitivity [95% CI]	Effect of matching	Aged 65+ "Model" Sensitivity [95% CI]
Race <sup>1</sup>			
White (92.6%)	43.1 [42.4 - 43.9]	-	16.68 [16.08 - 17.36]
Black (5.3%)	38.8 [35.3 - 42.3]*	Mitigated after matching for age	3.86 [2.58 - 5.21]*
Asians (1%)	27.6 [16.7 - 39.8]*	Maintained after matching for age	9.27 [2.99 - 16.67]
Ethnicity			
Hispanic / LA (5.4%)	46.5 [43.3 - 50.0]	-	3.22 [2.11 - 4.52]
Non-Hispanic / LA (94%)	42.5 [41.7 - 43.3]*	Mitigated after matching for age	16.59 [15.92 - 17.25]*
Insurance Type <sup>1</sup>			
Medicaid <sup>2</sup> (36.1%)	49.5 [48.4 - 50.5]	-	2.79 [2.41 - 3.25]
Medicare (14.5%)	52.0 [50.4 - 53.7]*	Reversed after matching for age	70.59 [68.83 - 72.37]*
Commercial (48.5%)	28.1 [27.0 - 29.3]*	Maintained after matching for age	4.32 [3.75 - 4.98]*
Sex			
Female (53.3%)	45.0 [44.2 - 45.9]	-	16.63 [15.82 - 17.48]
Male (46.7%)	39.7 [38.5 - 41.0]*	Mitigated after matching for age and number of visits	15.12 [14.20 - 16.15]

\*Significantly different at  $p < 0.05$  compared to reference category, always listed first.

CI = Confidence Interval; LA = Latin American

<sup>1</sup>Other race and insurer categories exist but each compose less than 1% of the population.

<sup>2</sup>Patients enrolled in Medicaid at any point in the last 11 years were placed in this category, even if they later shifted insurance (e.g. aged into Medicare).

Supplementary Table S11 (Calculations used for impact analysis)

Category	Population 2020	% top-risk selected for intervention @ Geisinger	At-risk people identified	Lay terms
G-primary care	641,000	10%	64,100	64 thousand
Pennsylvania	13,002,700	10%	1,300,270	1.3 million
United States	331,449,300	10%	33,144,930	33 million
World-wide (Global)	7,800,000,000	10%	780,000,000	780 million

Supplementary Table 11

SuppT11 includes calculations and references for calculating burden and impact of the Geisinger Flu-Flag Model were it used in practice to identify those at high risk of post-influenza flu complications, in an attempt to reduce vaccine hesitancy.

Assumptions, 2020
